

# A Chip in the Head: Brain Implants Will Be Connecting People to the Internet by the Year 2020

<http://endoftheamericandream.com>

*Note from Pastor Kevin Lea: Will this or similar technology will be used to “rehabilitate” those who oppose the coming one world government? The Bible teaches that the future world ruler will be able to deceive the world with great signs and wonders (2 Thessalonians 2) and force all to worship him as the world’s savior (Revelation 14 and 15). Could chip implantation be one way that he will use to control “dissidents?” Time will tell. Some have also noticed parallels with the novel (and movie), The Manchurian Candidate.*

Would you like to surf the Internet, make a phone call or send a text message using only your brain? Would you like to “download” the content of a 500 page book into your memory in less than a second? Would you like to have extremely advanced nanobots constantly crawling around in your body monitoring it for disease?

Would you like to be able to instantly access the collective knowledge base of humanity wherever you are? All of that may sound like science fiction, but these are technologies that some of the most powerful high tech firms in the world actually believe are achievable by the year 2020.

However, with all of the potential “benefits” that such technology could bring, there is also the potential for great tyranny. Just think about it. What do you think that the governments of the world could do if almost everyone had a mind reading brain implant that was connected to the Internet? Could those implants be used to control and manipulate us? Those are frightening things to consider.

For now, most of the scientists that are working on brain implant technology do not seem to be too worried about those kinds of concerns. Instead, they are pressing ahead into realms that were once considered to be impossible.

Right now, there are approximately 100,000 people around the world that have implants in their brains. Most of those are for medical reasons. But this is just the beginning. According to the Boston Globe, the U.S. government plans “to spend more than \$70 million over five years to jump to the next level of brain implants”. This new project is being called the Systems-Based Neurotechnology for Emerging Therapies (SUBNETS), and the goal is to be able to monitor the “mental health” of soldiers and veterans. The following is how a recent CNET article described SUBNETS...

SUBNETS is inspired by Deep Brain Stimulation (DBS), a surgical treatment that involves implanting a brain pacemaker in the patient’s skull to interfere with brain activity to help with symptoms of diseases like epilepsy and Parkinson’s. DARPA’s device will be similar, but rather than targeting one specific symptom, it will be able to monitor and analyse data in real time and issue a specific intervention according to brain activity.

This kind of technology is being developed by the private sector as well. In fact, according to Scientific American scientists are becoming increasingly excited about how brain implants can be used to “reboot” the brains of people with depression... Psychological depression is more than an emotional state. Good evidence for that comes from emerging new uses for a technology already widely prescribed for Parkinson’s patients. The more neurologists and surgeons learn about the aptly named deep brain stimulation, the more they are convinced that the currents from the technology’s implanted electrodes can literally reboot brain circuits involved with the mood disorder. Would you like to have your brain “rebooted” by a chip inside your head?

And of course this is how brain implants will be marketed to the public at first. They will be sold as something that has great “health benefits”. For example, one firm has developed a brain implant that can detect and treat epileptic seizures...
